

Classification of Hotel Reviews Using Sentiment Analysis

INTRODUCTION

TripAdvisor is one of the world's largest travel platforms that enables travellers to plan, book, and review their trips. TripAdvisor has become a go-to destination for travellers seeking information, advice, and recommendations for hotels, restaurants, attractions, flights, and more. TripAdvisor hosts millions of user-generated reviews and ratings for hotels, restaurants, attractions, and other travel-related services. Travellers can read reviews and ratings from other users to make informed decisions about their travel plans. The platform includes travel forums where users can ask questions, seek advice, and share experiences with fellow travellers. Forums cover a wide range of topics and destinations, allowing users to connect with like-minded travellers and experts. TripAdvisor offers travel guides and recommendations for popular destinations worldwide. Users can explore curated lists, itineraries, and recommendations for things to do, places to visit, and restaurants to try.

ABOUT THE DATASET

The dataset used for this project is made up of 20491 records collected from the user's hotel review from the trip advisor. The dataset contains three features that includes id, reviews, and rating. The dataset will be refined at the preprocessing stage and exploratory data analysis stage and further divided into train and test validation. 75% of the observation would be used as the train set , while 25% would be used as the test set.

ABOUT THE PROJECT

The main objective of the project is to perform sentiment analysis on hotel reviews obtained from TripAdvisor. The sentiment analysis will involve building a machine learning model that can automatically classify reviews into positive, negative, or neutral sentiments. This classification can help businesses and potential customers quickly understand the overall sentiment associated with a particular hotel. The project aims to provide valuable insights to hotel owners and managers about how customers perceive their establishments. By analysing the sentiments expressed in reviews, businesses can identify areas for improvement, address negative feedback, and capitalize on positive aspects. This can be achieved using Some of machine learning model include Support Vector Machine (SVM), Artificial Neural Networks (ANN), Decision tree and Logistic regression.
